Magento Integration Overview

Tradebox imports sales from Magento via the **Magento API**, which needs to be created, by the user, within the Magento control panel. Tradebox integration with Magento enables users to:

- Rapidly download orders, either routinely or on demand, based on order status
- Create customers and invoices in Sage
- Update stock levels in Sage (if required)
- Upload Sage free stock levels directly to the Magento inventory
- Accurately calculate VAT liability for all sales, including overseas sales.

Tradebox can **only import sales with a single currency**, which is established in the connection settings in the Tradebox software. If you have multiple currency sales you will need to create a separate connection in Tradebox to Magento for each currency.

Each individual order downloaded from Magento is cross referenced against the existing sales data in the Tradebox database to ensure duplication cannot occur in Sage. **Individual** invoices/orders are created in Sage Accounts for each order downloaded, containing comprehensive transaction and buyer details. Tradebox can be configured to create:

- Service Invoices (no stock control)
- Product Invoices (stock control)
- Sales Orders (stock control)

The user has the option to create and use a **single generic customer account** in Sage to report all Magento sales to, or alternatively, create **individual customer accounts** in Sage for each unique buyer.

Sequence of setting up

1. Configure Sage Accounts for Tradebox
2. Create API connection in Magento
3. Download and Install Tradebox
4. Create a Magento connection in Tradebox
5. Refine Magento connection settings
6. Optimise Tradebox and Sage reporting
7. Synchronise and download sales

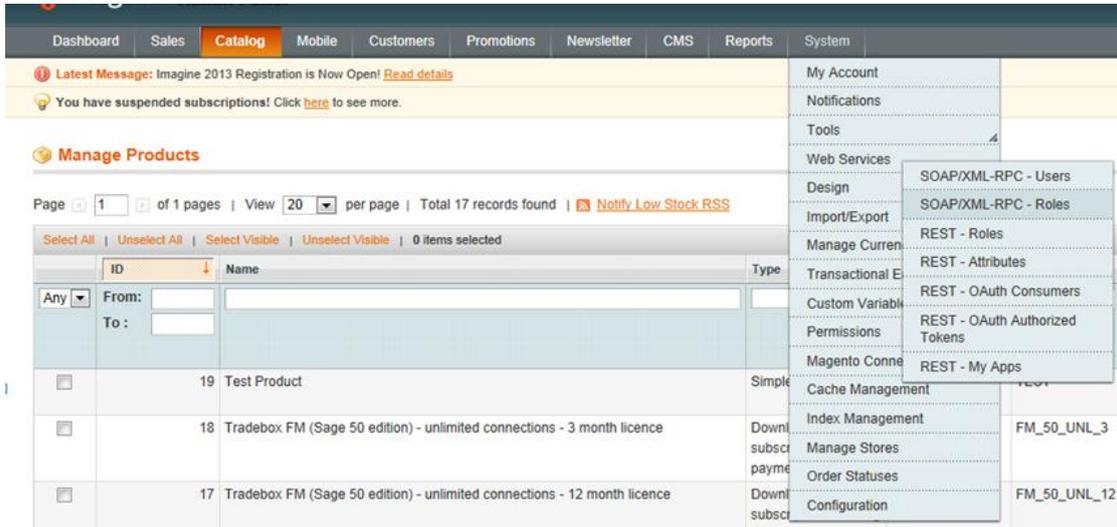

Sage Accounts set up

1. Install and configure **Sage Instant** or **Sage 50 Accounts** on your pc. Finance Manager is compatible with Sage Instant Accounts version 15 onwards and Sage 50 Accounts version 12 onwards.
2. **IMPORTANT:** If you use **Sage 50 Accounts 2008**, you **MUST** download and install the [Sage SDO Hotfix](#) prior to using Tradebox
3. Enable Sage Accounts **to connect to a third party application**. This can be achieved within Sage Accounts by clicking on **Tools – Activation – Enable 3rd Party Integration**. This will take you to a screen with a full set of instructions of how to gain the required enable keys from Sage.
4. Create a Sage Username specifically for Tradebox, to prevent logon issues. This does not require a multi user Sage licence as the username Tradebox utilises does not count against your Sage user allocation. This can be done in Sage by selecting **Settings – Access Rights**.
5. If you wish to gain stock control establish Product Records in Sage. An overview of how to do this is available by clicking [here](#).

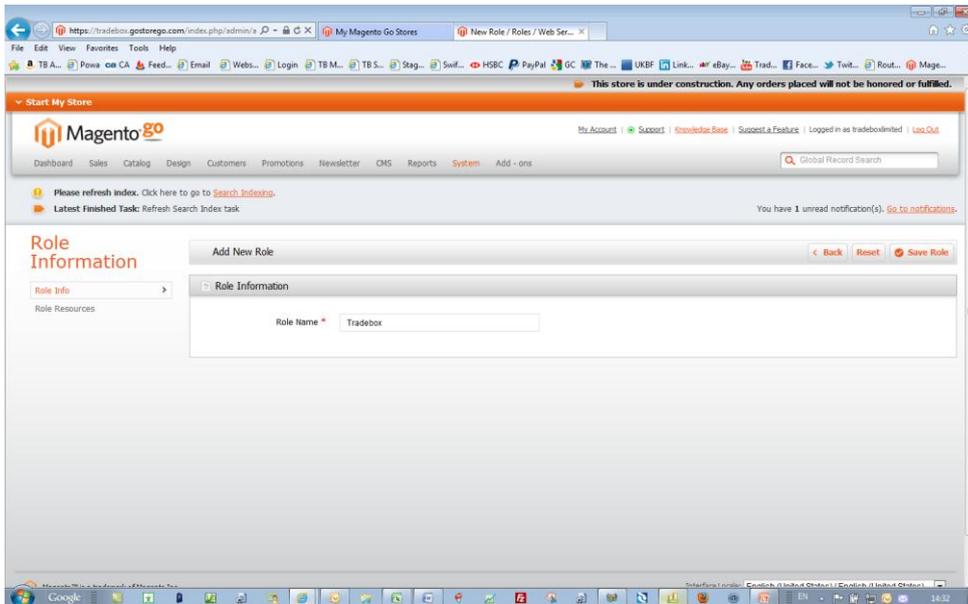

Action	Verify
Compatible version of Sage installed and registered	
3rd party integration activated in Sage Accounts*	
Set up Sage user specifically for Tradebox**	
Nominal codes created for sales	
Nominal codes created for expenses/fees	
Departments created, if required	
Generic customer accounts created, if required	
Bank Accounts set up, as required	
Suppliers created, as required	
Products created, if required	
Stock levels adjusted against existing products, if required	

Creating an API connection in Magento

- To set up the Magento API login to the Magento **Admin Panel** and navigate to **System – Web Services – SOAP/XML-RPC - Roles**.

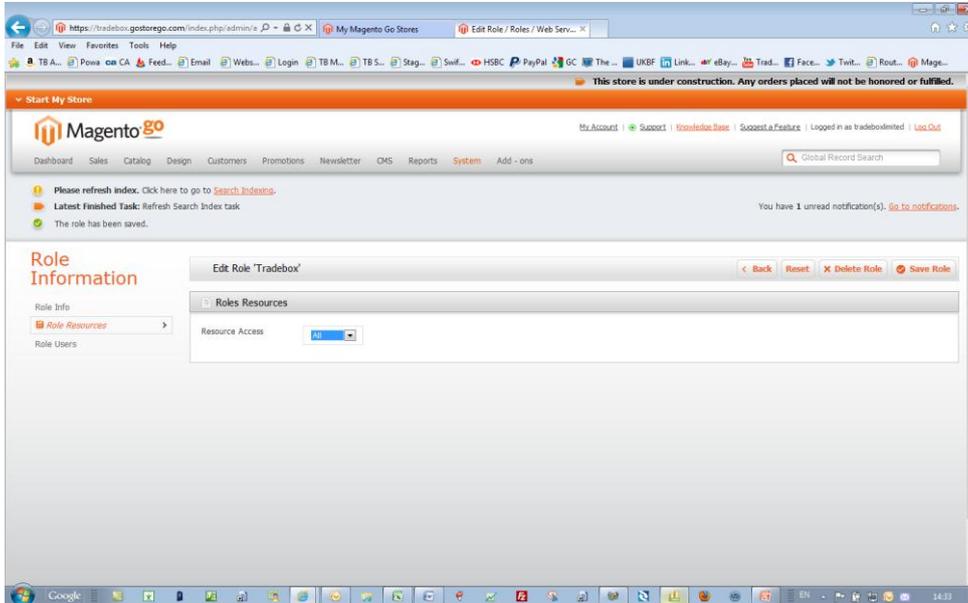

- Select **Add New Role** and give the role a description, i.e. **Tradebox** and then select **Save Role**.

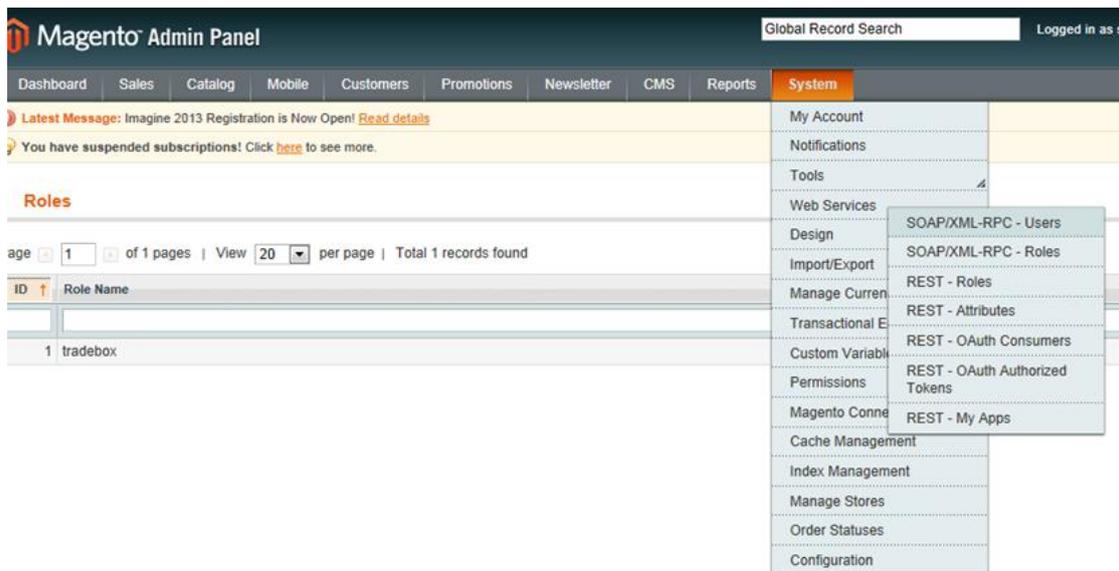

3. Select the **Role Resources** option to manage which permissions are available to users in this role. Tradebox recommend selecting **ALL**. Then select **Save Role**.

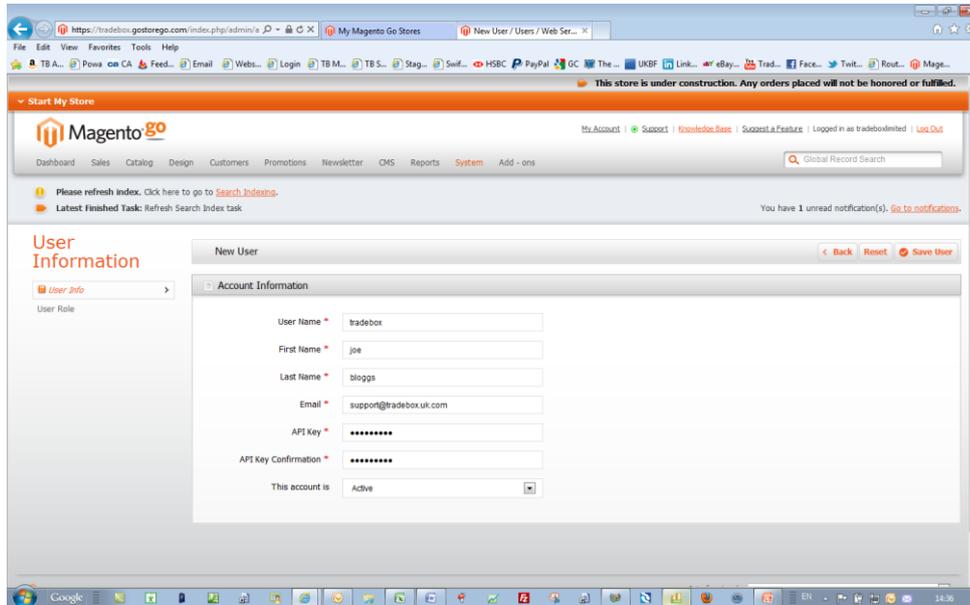

4. From the **System Menu**, select **Web Services** and **SOAP/XML-RPC - Users** and then select **Add New**

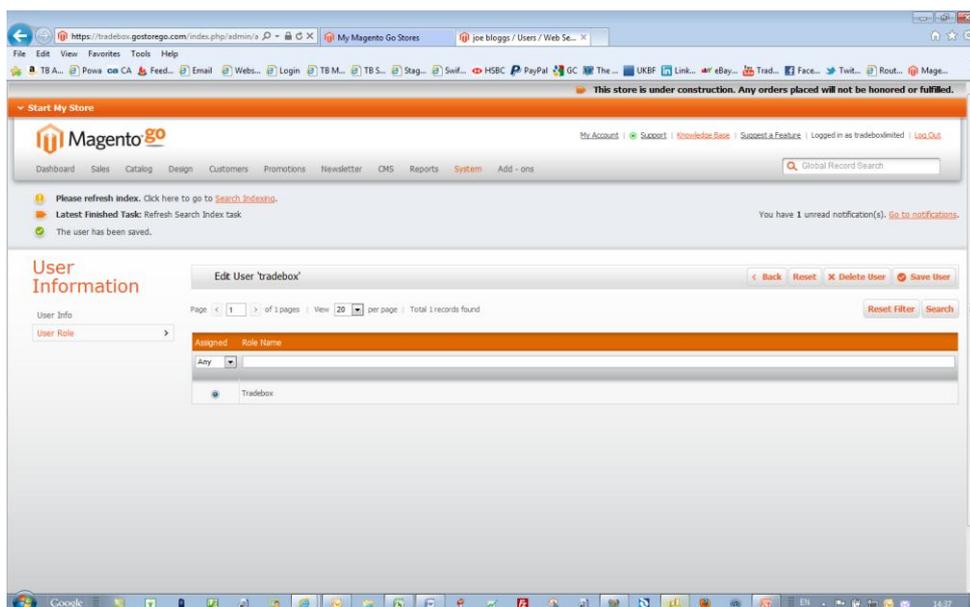

- The form generated asks for a User Name, First Name, Last Name, Email and API Key. Whilst all fields are mandatory, only the **User Name** and **API Key** need to be secure and will be used by Tradebox. The API Key is simply a password of the users choosing. Upon completion select **Save User**.

- Select the **User Role** link from the left hand menu. Select a **Role** from the list to **assign the User to the Role**. Then select **Save User**. The API connection is now set up.

Installing Tradebox Finance Manager

Tradebox Finance Manager can be downloaded from the [Tradebox website](#) by clicking on the **Download** button at the top of the web page.

This will generate the download page:

A screenshot of the "Download Tradebox" form. The title "Download Tradebox" is centered at the top. Below it is a sub-header: "Whether you wish to evaluate Tradebox for the first time, install on a new PC or simply upgrade your existing version, fill out the form and we will email you the instructions." The form contains four input fields: "First Name:" with the text "Edwar", "Last Name:", "Company:", and "Email Address:". A blue "DOWNLOAD" button is located at the bottom right of the form.

Simply fill out the form and select **Download** button at the bottom of the form. Tradebox will send you an automated email (to the email provided in the form) with a full set of download and installation instructions.

Creating and configuring a Magento connection in Tradebox

1. In Finance Manager, select **New Sales Channel** from the **Configuration** menu, select **Magento** from the drop down menu and click on **OK**.
2. This will display the **Sales Channel Setup Wizard** which is designed to guide the user through all of the configuration settings. The first screen is the **Introduction page**. Select **Next**.
3. The second screen is entitled **Magento Account** and enables the user to create a connection to the Magento API and establish the download criteria for Magento sales.
4. The **Account Name** of the connection. This is simply a label and can be called anything the user wishes. Every connection to an online marketplace in Tradebox Finance Manager is given an Account Name. These must be unique.

The screenshot shows the 'Sales Channel Setup Wizard' window. On the left is a navigation pane with the following steps: Introduction (checked), **Magento Account**, Company Selection, Account Selection, Transaction Types, Synchronisation, and Finish. The main area is titled 'Magento Account' and contains the following sections:

- Setup your Magento account defaults.**
- Magento Account Selection**
Enter the name of the Magento account you want to setup below.
Account Name: * Tradebox - Magento Store
- API Connection Details**
API URL: http://websiteURL/API/XMLRPC
API User Name: username
API Password: password
Test Connection...
- Sale Currency**
Currency: Pounds Sterling
 Post transactions in this currency
- Download Statuses**
Statuses: COMPLETE#PAID

Choose Next to continue...

Buttons at the bottom: Cancel, Back, Next, Finish

5. API Connection Details:

i. **API URL:** The Magento website URL followed by /api/xmlrpc/ e.g.
http://tradebox.uk.com/api/xmlrpc.

ii. **API Username:** username created in Magento in the user setup process

iii. **API Password:** API Key created in Magento in the user setup process

After entering these details select the '**Test Connection**' button to ensure details are valid.

6. **Sales Currency:** Select the currency of the sales you wish to import from Magento.
Each connection in Tradebox can only import sales in a single currency.

iv. Post transactions to Sage in the imported currency by **leaving the check box ticked**.
If you are importing foreign currency transactions and you leave this option ticked you will need Sage 50 Professional which needs to be set up in advance to deal with foreign currencies.

or

v. Convert foreign currency sales to Pounds Sterling by **unticking the check box**. If you choose this option Tradebox will convert the foreign currency into Pounds Sterling at the point of import using the latest currency conversion rates from a third party exchange rate service. This will create currency fluctuations which will need to be addressed periodically in Sage using journals to adjust for the exchange rate variance.

7. **Download Statuses:** If this field is left blank, Tradebox will import all sales. If you wish to impose filters on imported sales based upon the status, add them in this field followed by a # symbol, i.e. **COMPLETE #PAID**

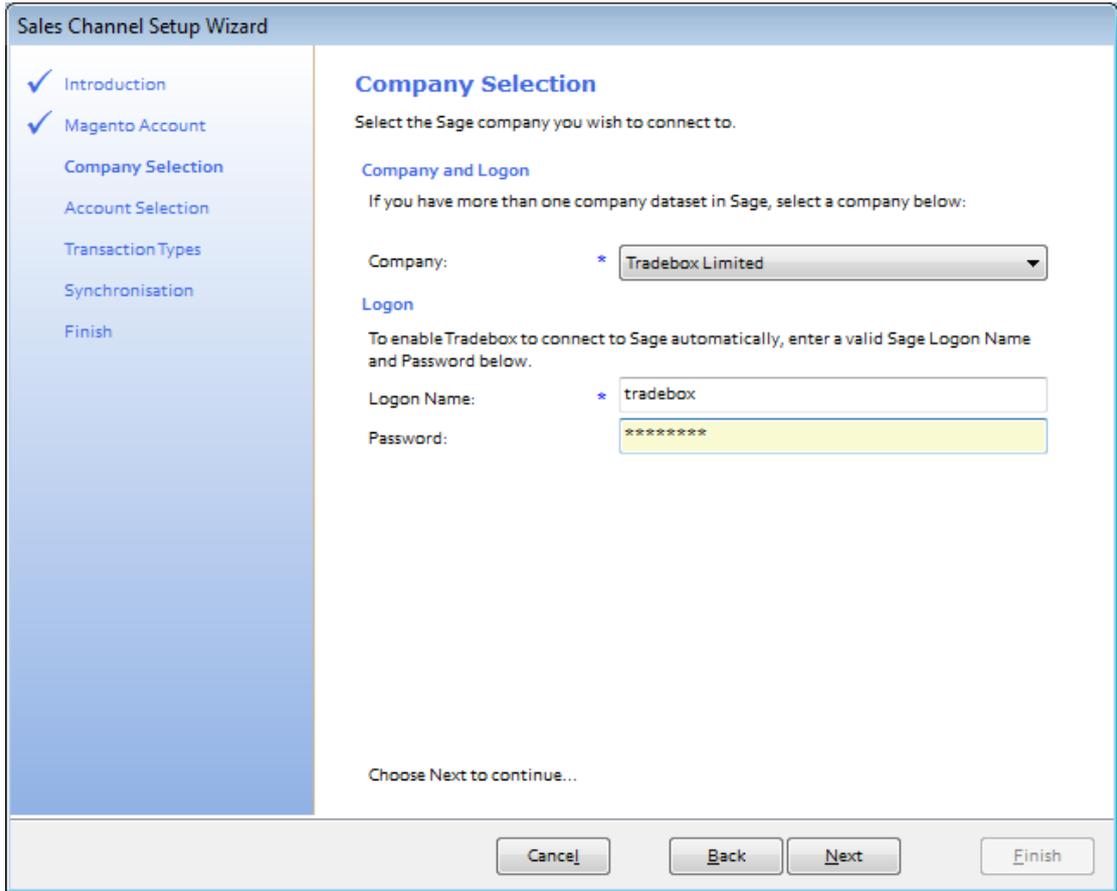

8. Click **Next**.

The third screen in the wizard is entitled **Company Selection** and enables the user to decide which company in Sage they wish to pass their sales into. Tradebox automatically detects where Sage is installed on the user's PC and displays this information in the Sage Folder field.

- 9. From the Company field select the Sage Company you wish to pass your sales data into. Please note that Tradebox enables you to pass data into the Sage Demo and Practice companies.

- 10. Provide an existing Sage username in the logon field for Tradebox to use. Please note that providing Tradebox with the MANAGER username often leads to logon conflicts. Tradebox highly recommends creating an additional user in Sage specifically for Tradebox's use.

11. Click on **Next**.

The fourth screen in the wizard is entitled **Account Selection** and enables the user to decide how to manage Customer Accounts in Sage and also to establish global nominal settings to report sales and carriage income to.

10. Users can choose to use a **single generic customer** account in Sage to report all Magento sales to, or, **to create individual customer** accounts in Sage for every unique buyer. **Regardless of this choice, a Generic Default Customer is always required.**
- a. To use a **single generic customer account** in Sage, either select a pre-existing Sage account from the drop down list, or choose the **Create Magento Account** button for Tradebox to create the Account. Ensure the Auto Generate option is turned to **NO**.
 - b. To create **individual customer accounts** in Sage you initially still need to select a pre-existing Sage account from the drop down list, or choose the **Create Magento Account** button. Then ensure the Auto Generate option is turned to **YES**.

Sage will only accept the following characters as valid to make up the **Sage Customer Account Reference**; **1 2 3 4 5 6 7 8 9 0 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z ! " \$ % & () - _ ' # . /**. Where invalid characters form the basis of the Sage Account Reference, Tradebox will allocate the Sage invoice to the default customer.

The screenshot shows the 'Sales Channel Setup Wizard' window. On the left is a navigation pane with steps: Introduction, Magento Account, Company Selection, **Account Selection** (highlighted), Transaction Types, Synchronisation, and Finish. The main area is titled 'Account Selection' and contains the following fields and options:

- Customer Account:** A dropdown menu showing 'WEBSALES - Website Sales' and a 'Create Magento Account...' button.
- Auto Generate:** Radio buttons for 'Yes' and 'No', with 'No' selected.
- Nominal Accounts:** A section with the instruction 'Select the nominal accounts you want the Magento sales and carriage to be posted to:'.
 - Sales Nominal:** A dropdown menu showing '4004 - Web Sales'.
 - Override Product Nom.:** Radio buttons for 'Yes' and 'No', with 'No' selected.
 - Carriage Nominal:** A dropdown menu showing '4905 - Distribution and Carriage'.

At the bottom, there are buttons for 'Cancel', 'Back', 'Next' (highlighted), and 'Finish'. The text 'Choose Next to continue...' is visible above the 'Next' button.

12. From the **Sales Nominal** field choose a Sales Nominal Code from Sage to report your Magento Sales to. This is a global setting. If you elect to create Product Invoices or Sales Orders (in the next page of the wizard) Tradebox will, by default, report the sales to the nominal code held within the **Sage Product Record**. If you wish to override this default and simply report sales income to the single global nominal code select the **YES** option next to **Override Product Nom.**

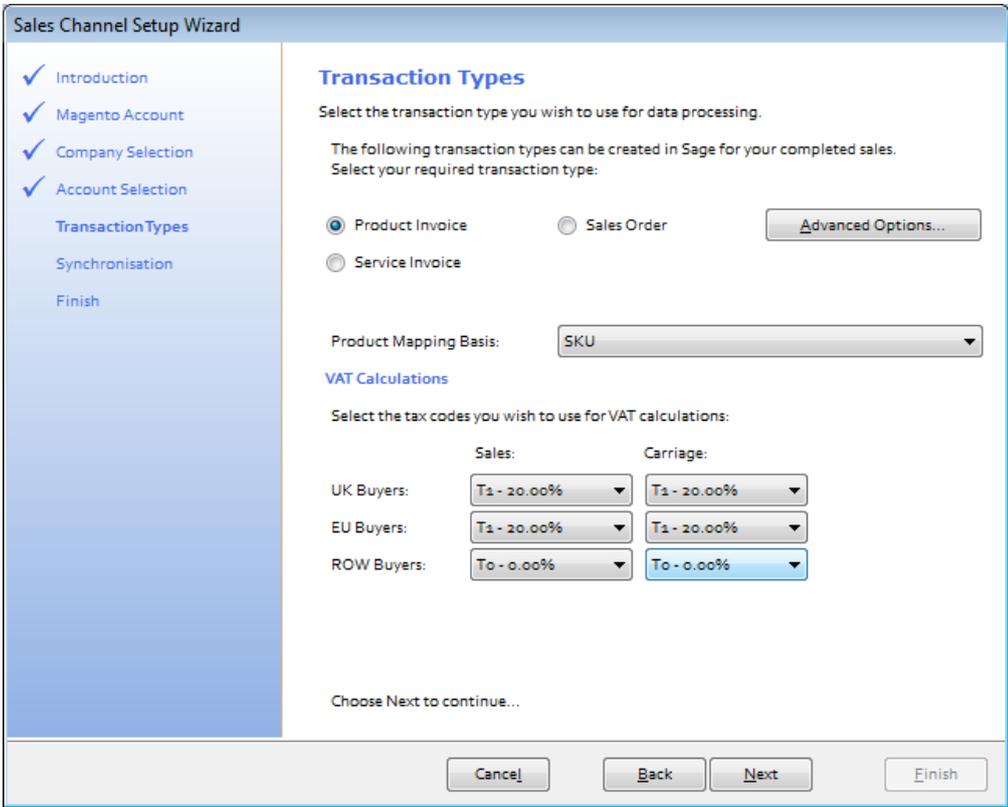

13. From the **Carriage Nominal** field choose a Sales Nominal Code from Sage to report your carriage income to. Again, this is a global setting. Different shipping options can be mapped to separate sales nominal codes after the connection has been established.

14. Click on **Next**.

The fifth screen in the wizard is entitled **Transaction Types** and enables the user to choose what type of transaction they wish to create in Sage Accounts:

- Service Invoice – No Stock Control
- Product Invoice – Stock Control (Recommended for stock control)
- Sales Order – Stock Control (requires Sage 50 Professional)

If you are unsure of the best transaction type to create, please refer to the **online retailer's guide to Sage Accounts** which can be downloaded by clicking [here](#).

Where Product Invoices or Sales Orders have been chosen, a **Product Mapping Basis** needs to be selected to enable Tradebox to match the product sold online to a Product in Sage. Using SKU as the mapping basis is recommended. Where SKU is chosen, Tradebox will attempt to automatically match the online SKU to an existing Sage Product Code where both identifiers are identical. If Tradebox cannot find an exact match it will invite the user to manually map the SKU to a Sage Product Code in Error Corrections and will save this relationship for future use in the **Product Mapping** table.

15. The VAT calculations grid enables Tradebox to establish rules on calculating VAT on overseas sales. By default UK and EU sales are set to the Sage T1 tax code and Rest of World Sales (ROW) are set to T0. The tax rates for these codes are picked up directly from Sage.

If the user has chosen to create Product Invoices or Sales Orders, Tradebox will initially read the Tax code from the Sage Product Record and use this as the default for UK and EU sales.

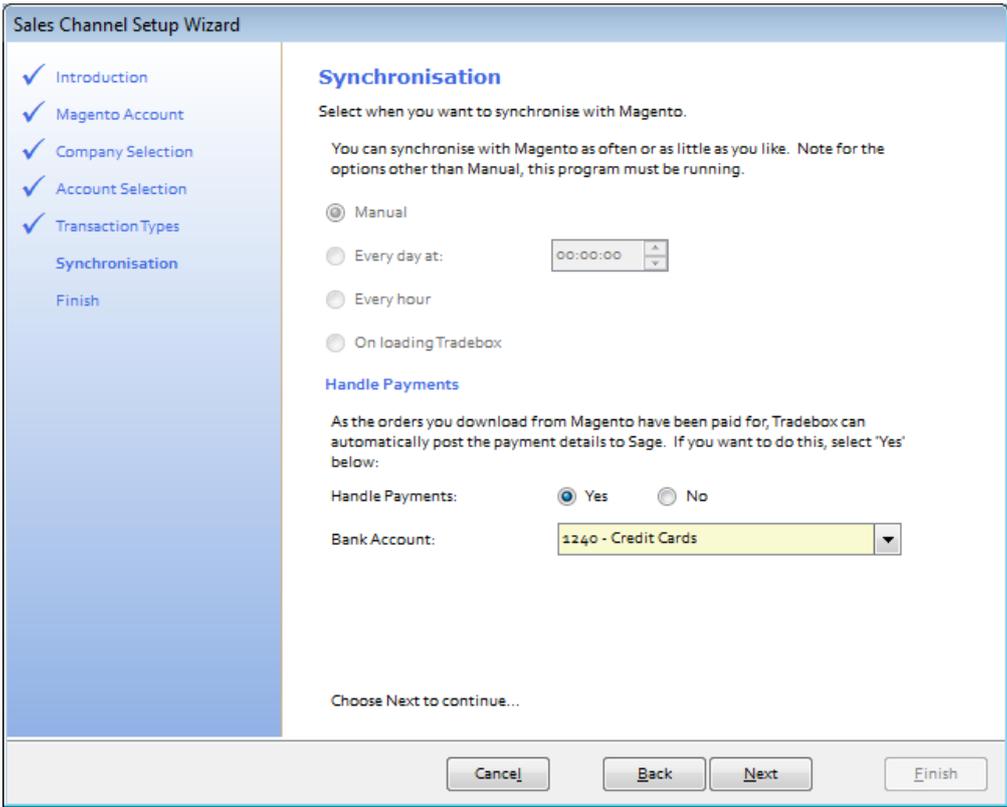

16. Click on **Next**.

The sixth screen in the wizard is entitled **Synchronisation** and enables the user to choose when to import sales and also how to handle Sales receipts in Sage.

- 17. The user has 4 **Synchronisation** options:
 - a. Manual – every time they select the Synchronise button
 - b. Every day at a specified time
 - c. Every hour (Tradebox must be closed and re-opened for this setting to take effect).
 - d. On loading Tradebox

The synchronisation method is a global setting so will apply to all connections. This option may appear 'greyed out' if another connection already exists. A manual synchronise can always be ran even if an automated option has been chosen.

- 18. Under the **Handle Payments** area of the wizard screen, the user can choose whether or not to automatically pay an individual sales receipt into a nominated bank account in Sage. All invoices created by Tradebox in Sage are **unposted**. If you choose to process

the sales receipt then this will be automatically paid into a nominated Sage bank account when the invoice is updated/posted to the ledgers.

Where a connection has multiple payment methods (PayPal, Sage Pay, WorldPay etc) these can be allocated to different banks in Sage, so all PayPal sales receipts get created in a PayPal bank in Sage and all WorldPay sales receipts get created in a WorldPay bank in Sage.

Creating 'notional' banks in Sage to reflect and contain activity for a given payment method is a widely used approach by many online retailers. Doing this allows large volumes of individual transactions from a given payment method to be isolated away from the businesses other transactions, assisting in the reconciliation process.

The above is **NOT applicable** if Sales Orders (SO) have been chosen as the transaction type for Tradebox to create.

Sales Orders

If **Sales Orders** (SO) are chosen as the transaction type for Tradebox to create, Sales Receipts (SR) will NOT be paid into a bank, as illustrated above. This is because Sales Orders operate in a different way in Sage, as follows:

1. Sales Order is created in Sage by Tradebox automatically creating a Sales Receipt on Account (SA), against the Sage Customer Account. Effectively this credits the Sage Customer Account as a payment taken in advance of an invoice being raised.
2. Once the SO has been marked as dispatched, Sage will automatically create a Product Invoice. When the Invoice is updated to the ledgers a Sales Invoice (SI) is created against the Sage Customer Account. Generally this will contra off the SA leaving a balance on the Customer Account of zero.
3. However, both transactions will still be outstanding and will need to be allocated against each within a bank. To do this the user needs select the relevant bank within Sage, click on the Customer button and choose the Customer Account from the drop down list. Both transactions (SA and SI) will appear. Marking both as paid in full will allocate the transactions together.

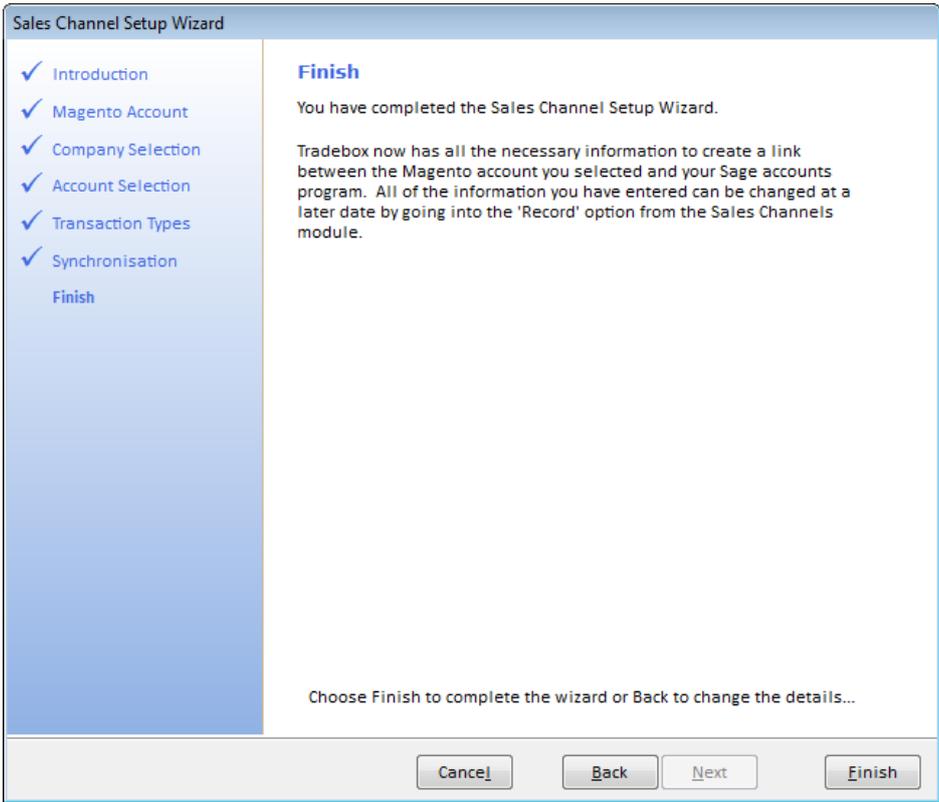

Where the user has chosen to create individual customer accounts in Sage, the task of allocating the transactions together in the bank will become significantly time consuming, especially if they conduct many online transactions.

A work around does exist for this is Tradebox, which prevents the creation of an SA to the Customer Account and allocates a Sales Receipt against the invoice, as described for Service and Product invoicing. However, this only works where the SO is fully dispatched and should not be used if SO's are partially dispatched.

The work around can only be applied after the set up wizard is complete and the connection has been set up. Once done, select the Sales Channel List and double click on the connection. In the screen displayed, untick the **Post Sales Receipts** tick box and then re-tick it. A dialog box will be displayed to confirm this setting. Click on **OK**.

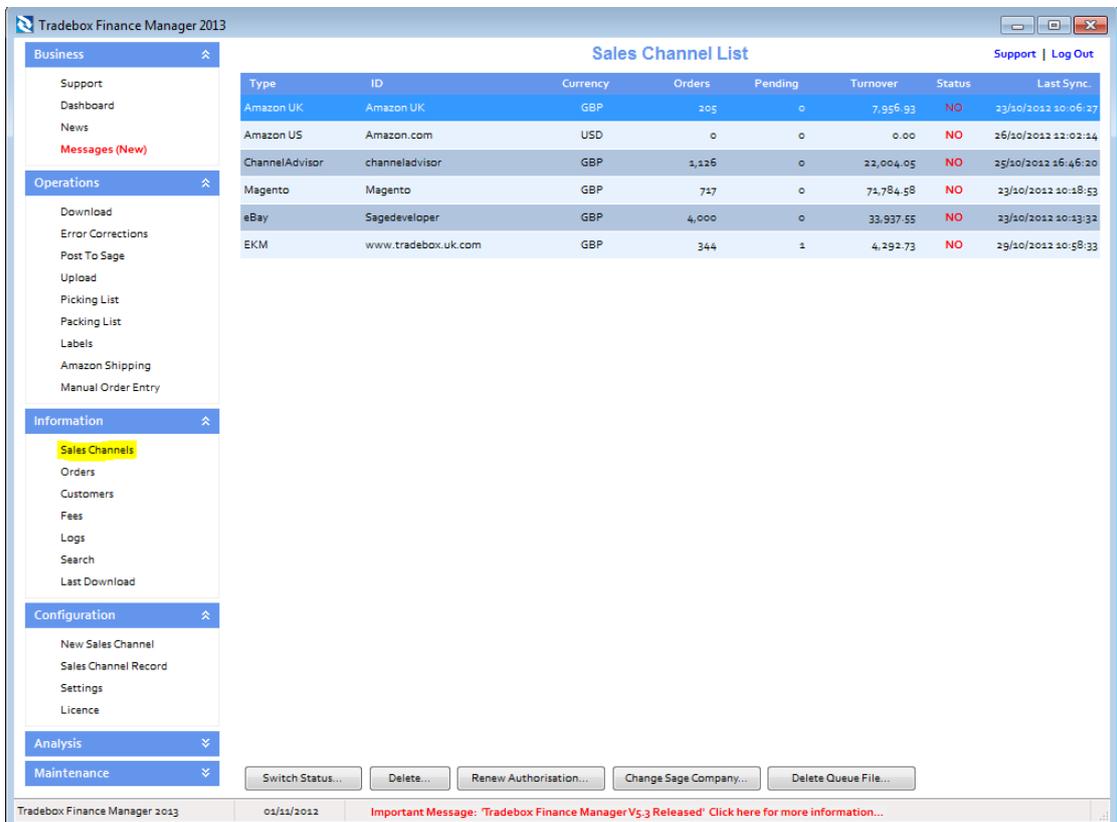

19. Click **Next** and on the final page of the wizard select **Finish**.

Applying and refining additional settings

Sales Channel List

Upon completion of the **Sales Channel Setup Wizard**, a connection to Magento will be established in the **Sales Channel List**. This is the working screen of the software and contains an overview of every marketplace/website a connection has been created for. To access the Sales Channel List, select the **Sales Channels** option from the **Information** menu.

Type	ID	Currency	Orders	Pending	Turnover	Status	Last Sync.
Amazon UK	Amazon UK	GBP	205	0	7,959.93	NO	23/10/2012 10:06:37
Amazon US	Amazon.com	USD	0	0	0.00	NO	26/10/2012 12:02:14
ChannelAdvisor	channeladvisor	GBP	1,126	0	22,004.05	NO	25/10/2012 16:46:20
Magento	Magento	GBP	717	0	71,784.58	NO	23/10/2012 10:18:53
eBay	Sagedeveloper	GBP	4,000	0	33,937.55	NO	23/10/2012 10:13:32
EKM	www.tradebox.uk.com	GBP	344	1	4,292.73	NO	29/10/2012 10:58:33

The command buttons at the bottom of the Sales Channel List affect the connection selected in the list at the time of selection.

Double clicking on the connection in the Sales Channel List opens the **Sales Channel Record** which contains all of the settings and configuration for that specific connection. The Sales Channel Record also holds all of the **mapping tables** for the connection which record and store the relationships between the data downloaded from the online marketplace/website and the entries in Sage.

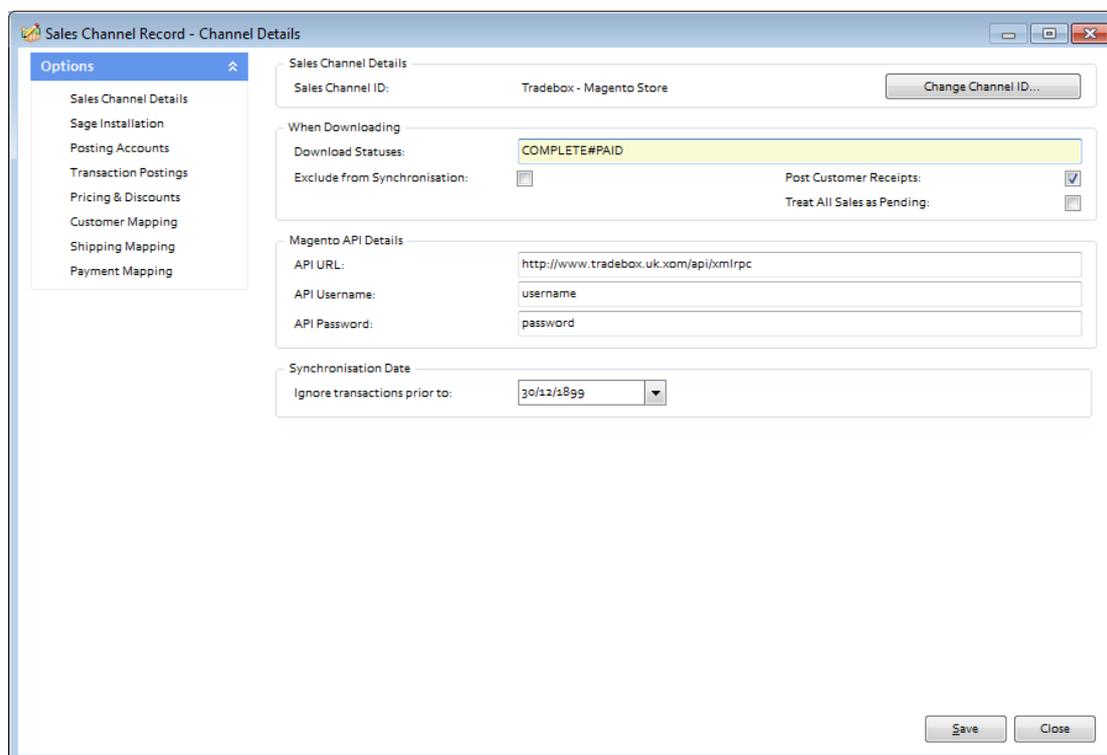

These tables cover mappings for:

- Customers
- Products
- Shipping Methods
- Payment Methods

The following pages will cover additional features and settings not explained in the previous wizard walkthrough.

Sales Channel Details

The first page of the Sales Channel record is the **Sales Channel Details** page. This page holds a variety of additional settings that can be applied and/or changed.

The **'Change Channel ID'** button allows the user to rename the connection. Simply click on this button and enter a new name. All sales channel names must be unique.

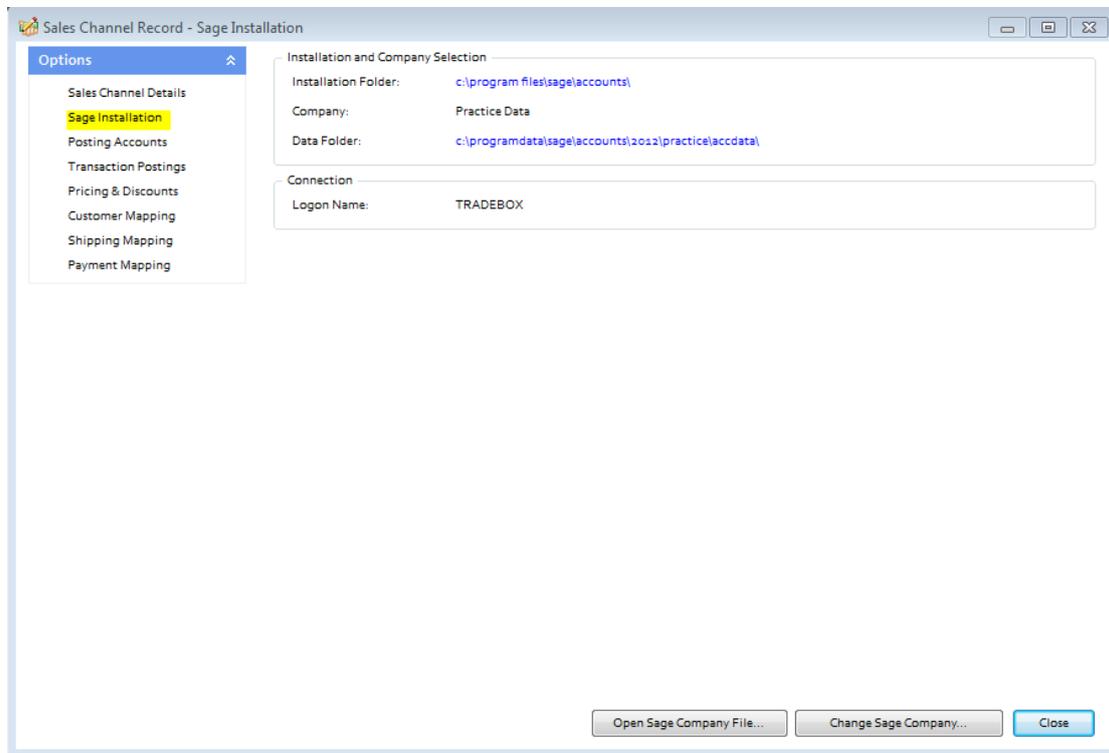

Exclude from Synchronisation suspends the connection and excludes it from the download or upload process.

'Post Customer Receipts' ensures that a Sales Receipt is paid into a nominated Sage bank upon updating the Sage invoice created by Tradebox.

Treat all Sales as Pending places all sales imported from the connection directly into the **Pending Folder**.

The **Synchronisation Date** option allows the user to establish a rule for Tradebox to **ignore sales prior to a specified date**. The **Save** button must be selected to record any changes made.

Sage Installation

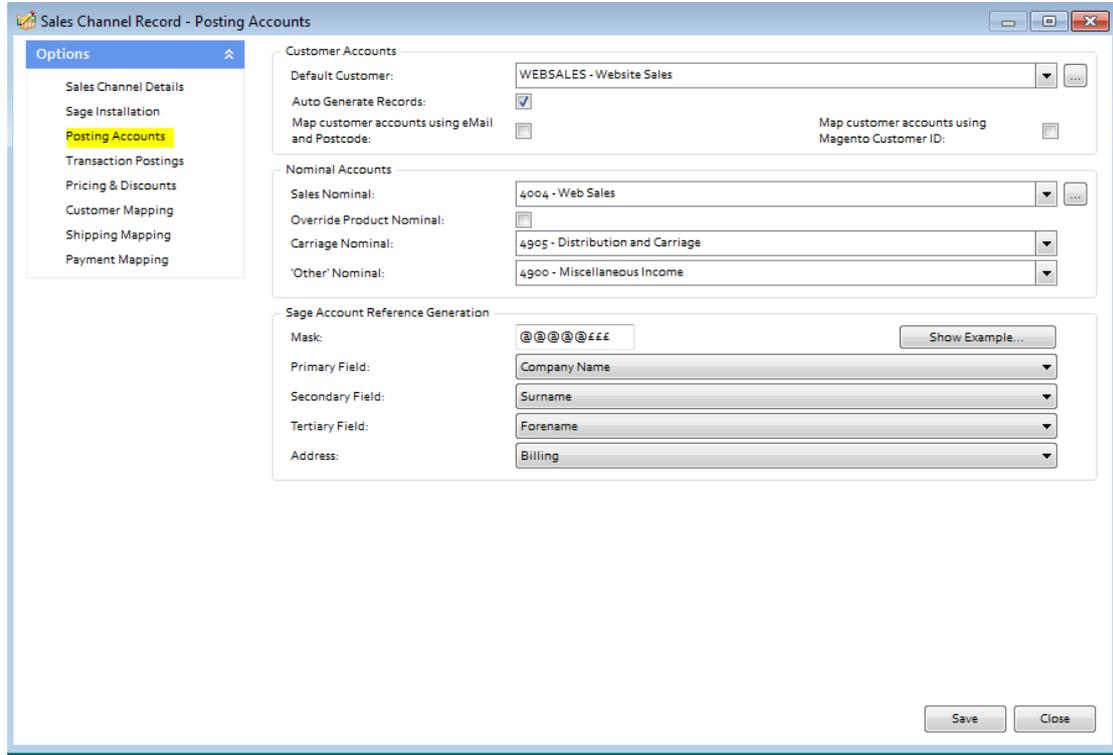

The Sage Installation screen shows the user which Sage Company Tradebox is pointing to and where the Magento Sales downloaded will be created.

This screen also shows the Sage user name that has been provided by the user to enable Tradebox to log into Sage. Tradebox highly recommends creating a unique Sage user name specifically for Tradebox. Providing Tradebox with the standard Sage 'Manager' username, often leads to login conflicts.

These details can be changed by selecting the '[Change Sage Company](#)' button.

[Open Sage Company File](#) opens the local Sage Company file (in Notepad) containing a list of all Sage companies in the user's data set. This feature should only be used when directed by Tradebox support.

Posting Accounts

Map customer accounts using email and Postcode is only applicable if the option to **auto generate individual customer** records in Sage has been chosen. Ticking this option instructs Tradebox to search through existing customer records in Sage and determine if a customer already exists based upon the email and postcode in the imported order. If there is a **match for both criteria** then Tradebox will link the order to the existing customer account. If there is not match Tradebox will create a new customer record. This feature will slow the import routine and requires that the Sage user name provided to Tradebox has Full Access.

'Map customer accounts using Magento Customer ID' allows the internal Magento Customer ID to be used as the Sage Account Reference.

Sage Account Reference Generation: This feature allows the user to determine how the **Sage Customer Account Reference (SCAR)** should be configured and is only applicable if the option to create individual customer records has been chosen. Customer Account References in Sage have a maximum of 8 characters. The tools in this section allow the user to determine:

- a. What information the SCAR should be based upon
 - i. Company Name
 - ii. Surname
 - iii. Forename
- b. The priority the data upon which the SCAR is based should be in
- c. Which address information to base the SCAR upon (billing address or shipping address)
- d. The format of the SCAR in terms of letter and numbers through the use of a Mask.

The 3 pieces of information upon which the Sage Customer Account Reference can be based are the buyer's company name, surname or forename. The priority of this information is established in the primary, secondary and tertiary fields. Where information on the highest priority field may not exist in the feed, Tradebox will move to the second priority and then the third. So, in the above example the highest priority is the company name. If this exists in the feed it will be used. If this field is blank, Tradebox will move to the second priority, which in the above example is the buyer's surname.

Mask: The mask allows the user to establish how many letters and/or number to use in the creation of the Sage Customer Account Reference (SCAR). In the mask:

- @ equals a letter
- £ equals a number

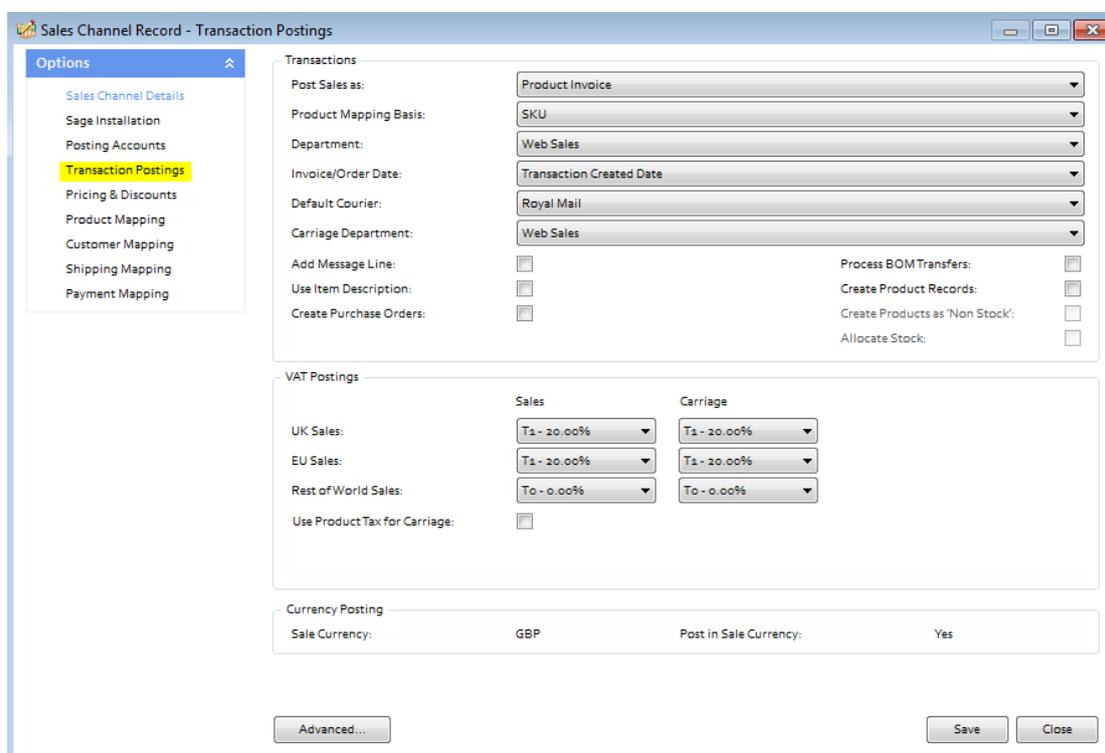

Using the above example (@@@@£££) Tradebox would create the SCAR using the first 5 characters of the data followed by 3 numbers. The numbers are incremental to allow separation of different customers with similar information. For example, if John Smith and Adam Smith made purchases Tradebox would create SMITH001 and SMITH002 Customer Account References in Sage.

The mask can also contain prefixes. So, if you wished to prefix the SCAR with an 'M' (for Magento) then you would simply type the letter into the mask as follows:

M@@@@£££

The mask will always be limited to 8 characters, which is the maximum Sage allows.

Transaction Postings

The Transaction Postings screen enables a number of additional settings to be applied, as follows:

Department: allows the user to allocate sales income from imported Magento sales to an established department in Sage. This is useful to isolate sales income in Sage from a given marketplace.

Invoice/Order date: This is the date used on the Sage invoice. By default this is set to the date the transaction occurred. However this can be changed to the **Paid Date** or the **Downloaded Date**.

Default Courier: allows an existing default courier from Sage to be added to the order details on the Sage invoice

Carriage Department: allows carriage income to be allocated to an established department in Sage. This is useful to isolate carriage income in Sage from a given marketplace.

Add Message Line: allows the user to add any message left by the customers onto the invoice in Sage.

Use Item Description: uses the product description from Magento on the Sage invoice, as opposed to using the description from the Sage Product record.

Create Purchase Orders: Automatically creates **Purchase Orders** in Sage to the supplier of the product, at the established cost price, for delivery to the buyer. Product needs to be specifically marked as a dropship item in the **Product Mapping** Screen first. **Requires Sage 50 Accounts Professional.**

Process BOM Transfer: Instructs Tradebox to transfer component parts into a pre-existing Bill of Materials (BOM) in Sage, as and when an order containing a BOM product is downloaded. Requires Sage 50 Accounts Plus or Professional.

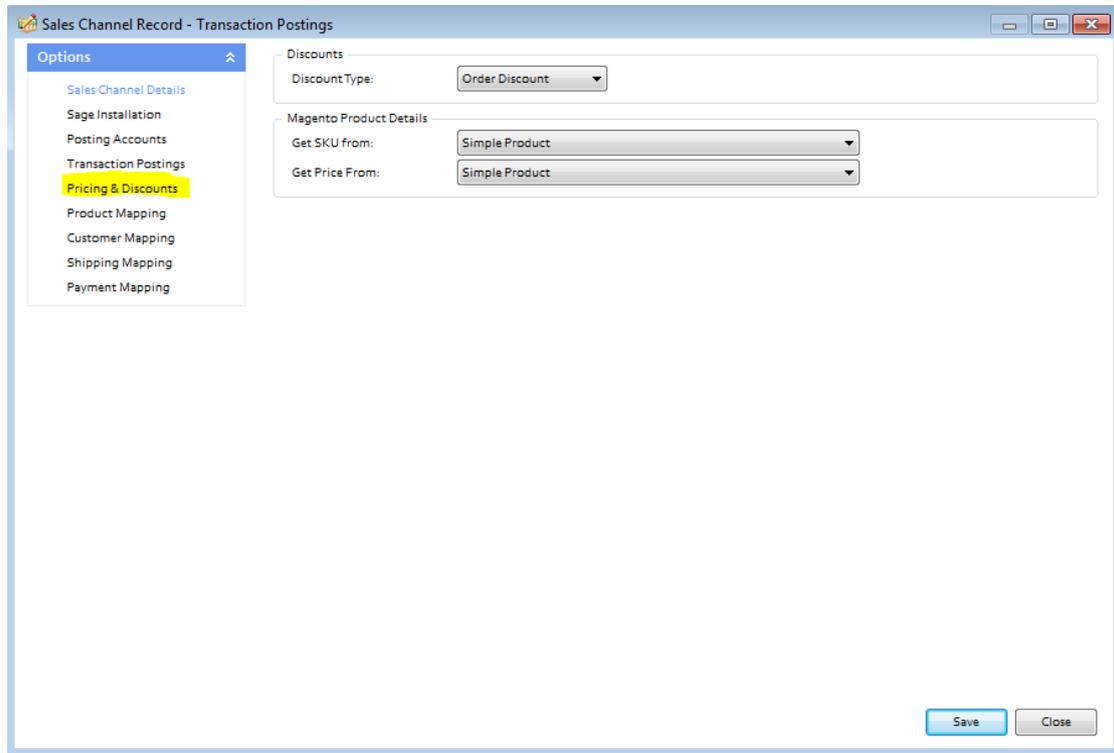

Create Product Records: Instructs Tradebox to automatically create a new product record in Sage for any Magento product it cannot automatically match to an existing Product in Sage. Products created in Sage by Tradebox only contain a Product Code, Description, the Sage default tax code and the Sage default nominal code. All other information that can be entered against a Sage product, such as location, supplier, cost price, sales price, quantity in stock etc., will need to be added manually. Generally this function is used as an initial option to get stock records set up in Sage. **It is NOT recommended to have this function permanently turned on.**

Create Products as Non Stock: If the user has chosen to auto create products in Sage then this setting allows them to specify the creation of Non Stock products, i.e. product records that do NOT carry a quantity.

Allocate Stock: Where Sales Orders have been chosen as the transaction type to be created, Tradebox will automatically allocate stock to the Sales Order upon creation. **Requires Sage 50 Accounts Professional**

Use Product Tax for Carriage: Where Product Invoices or Sales Orders have been chosen as the transaction type in Tradebox, the software has the ability to amend the VAT liability on Carriage in line with the first product in the order.

Pricing & Discounts

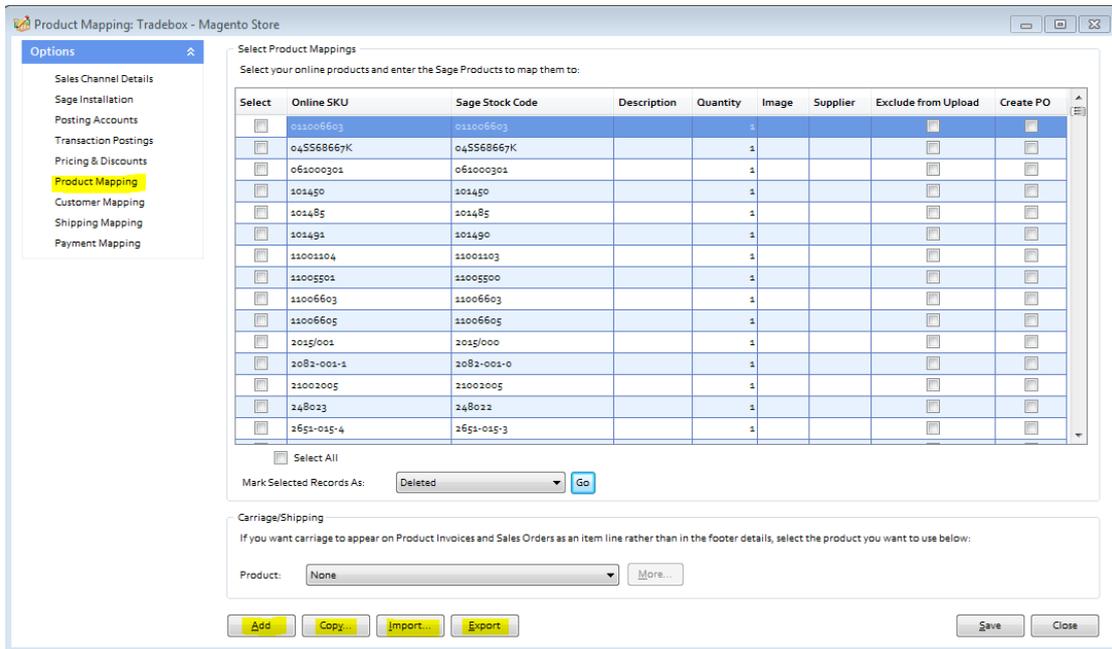

The screenshot shows a software window titled "Sales Channel Record - Transaction Postings". On the left is a navigation menu under "Options" with items: Sales Channel Details, Sage Installation, Posting Accounts, Transaction Postings, Pricing & Discounts (highlighted), Product Mapping, Customer Mapping, Shipping Mapping, and Payment Mapping. The main area contains two sections: "Discounts" with a "Discount Type:" dropdown set to "Order Discount", and "Magento Product Details" with "Get SKU from:" and "Get Price From:" dropdowns, both set to "Simple Product". At the bottom right are "Save" and "Close" buttons.

The Pricing & Discounts section allows users to configure Tradebox to deal with discount types, as well as providing options on which product type to obtain the Magento SKU from and which Product to get the Price from.

Product Mapping

The Product Mapping screen holds the relationship between the online product and the corresponding Sage Product Code. This relationship or mapping can be either **Online SKU** mapped to **Sage Product Code**, or, **Online Product Title** mapped to **Sage Product Code**

In both instances the online product identifier is always mapped to the **Sage Product Code**. This choice is established during the sales channel set up wizard.

Select	Online SKU	Sage Stock Code	Description	Quantity	Image	Supplier	Exclude from Upload	Create PO
<input type="checkbox"/>	011006603	011006603		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	045568667K	045568667K		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	061000301	061000301		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	101450	101450		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	101485	101485		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	101491	101490		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	11001104	11001103		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	11005501	11005500		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	11006603	11006603		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	11006605	11006605		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	2015/001	2015/000		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	2082-001-1	2082-001-0		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	21002005	21002005		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	248023	248022		1			<input type="checkbox"/>	<input type="checkbox"/>
<input type="checkbox"/>	2651-015-4	2651-015-3		1			<input type="checkbox"/>	<input type="checkbox"/>

In most cases the product mappings in the table are created **automatically** as sales are imported into Tradebox. Online product SKU's are mapped automatically when the online SKU and the Sage Stock Code are an exact match. If the online SKU imported does not match an existing Sage Stock Code, Tradebox alerts the user and invites them to manually allocate the non-matching online SKU to an existing Sage Stock Code.

Product Mappings can be added one at a time by clicking on the **Add** button.

Product Mappings can be copied from another existing connection by selecting the **Copy** button.

Alternatively, Product Mappings can be imported in a csv file in advance of using Tradebox by utilising the **Import** button. The csv template can be obtained by selecting **Export** button and saving the csv file locally.

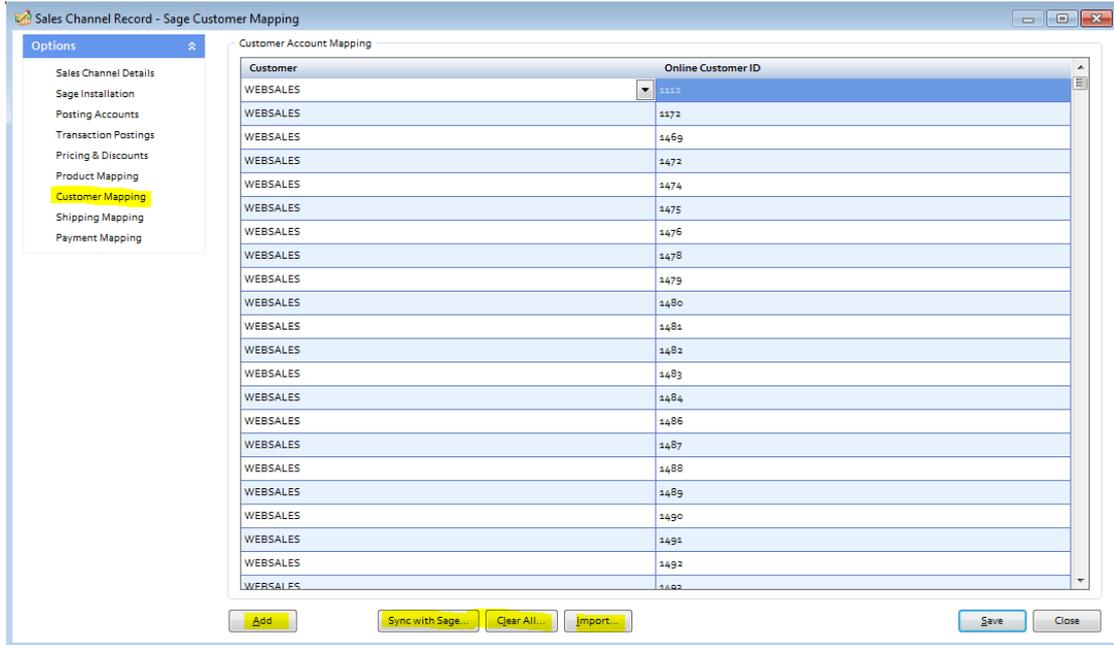

Where the user wishes to automatically create Purchases Orders in Sage for given products these need to be identified in this screen by ticking the **Create PO** box next to the relevant product. The **Create Purchase Orders** box also needs to be ticked in the **Transaction Postings** section of the Account record. When Tradebox imports an order with a product that has been marked as **Create PO**, it will automatically raise a Purchase Order (PO) in Sage, with the Product Suppliers name and billing address, at the last cost price with the buyers shipping address. For this to work seamlessly, the Sage Product Record needs to have a supplier allocated to it and have cost prices recorded against it. **Requires Sage 50 Accounts Professional.**

If the user wishes the **shipping method to appear on the body of the Sage invoice/order** as a product line, rather than in the footer of the invoice, then a default carriage product needs to be selected from the drop down menu under the **Carriage/Shipping section**. Further settings need to be established in the **Shipping Mapping section**.

Customer Mapping

The Customer Mapping screen holds the relationship between the **Sage Customer Account** and the unique buyer details in Tradebox and enables Tradebox to recognise which existing Sage Account to use for a returning buyer.

Customer Mappings are created automatically by Tradebox when importing orders. However, Customer Mappings can be added by clicking on the **Add** button.

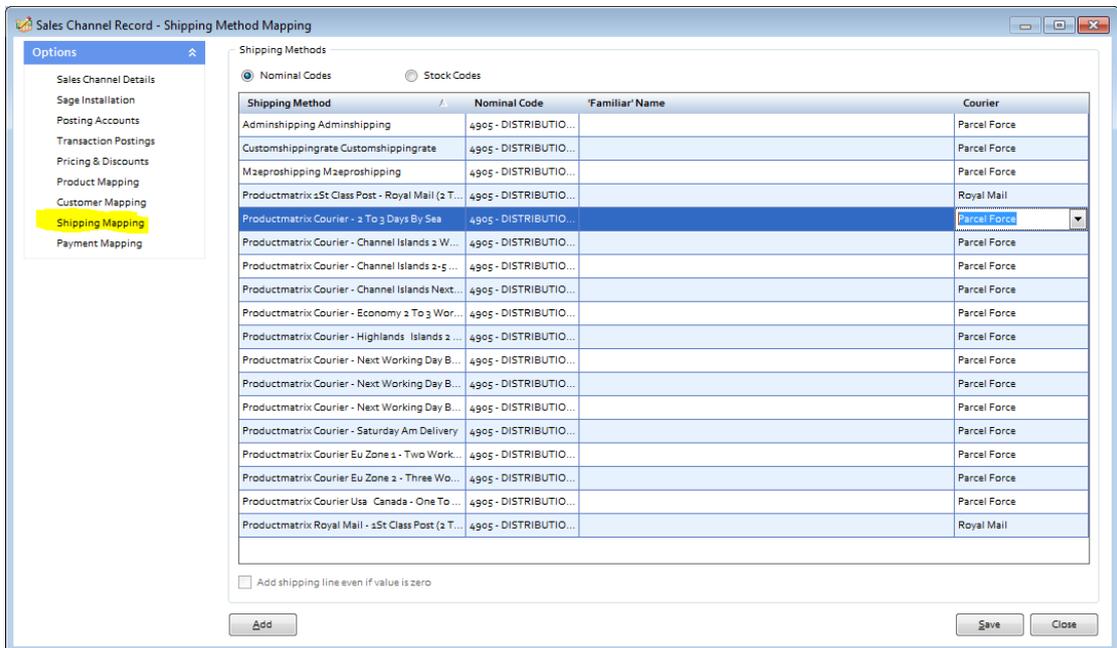

Customer Mappings can be copied from another existing connection by selecting the **Copy** button. Alternatively, Customer Mappings can be imported in a csv file in advance of using Tradebox by utilising the **Import** button.

A common mapping error results when Sage Customer accounts, that have been created by Tradebox, are deleted from Sage. The error results because the Sage Customer Account Reference (SCAR) held in the Tradebox database no longer exists in Sage. Selecting the **Sync with Sage** button will recreate any missing Sage Customer Accounts in Sage that are held in the customer mapping table. This can take some time depending upon the amount of customer records held in Tradebox and sage Accounts.

Shipping Mapping

The Shipping Mapping screen shows how carriage is reported onto a Sage invoice and also how the income from carriage is reported into Sage.

By default Tradebox displays the carriage amount on the carriage footer of the Sage invoice and reports the carriage income to the default carriage nominal code, as established in the Sales Channel Setup Wizard. Nominal code reporting can be amended in this screen so different shipping methods are reported to different nominal codes.

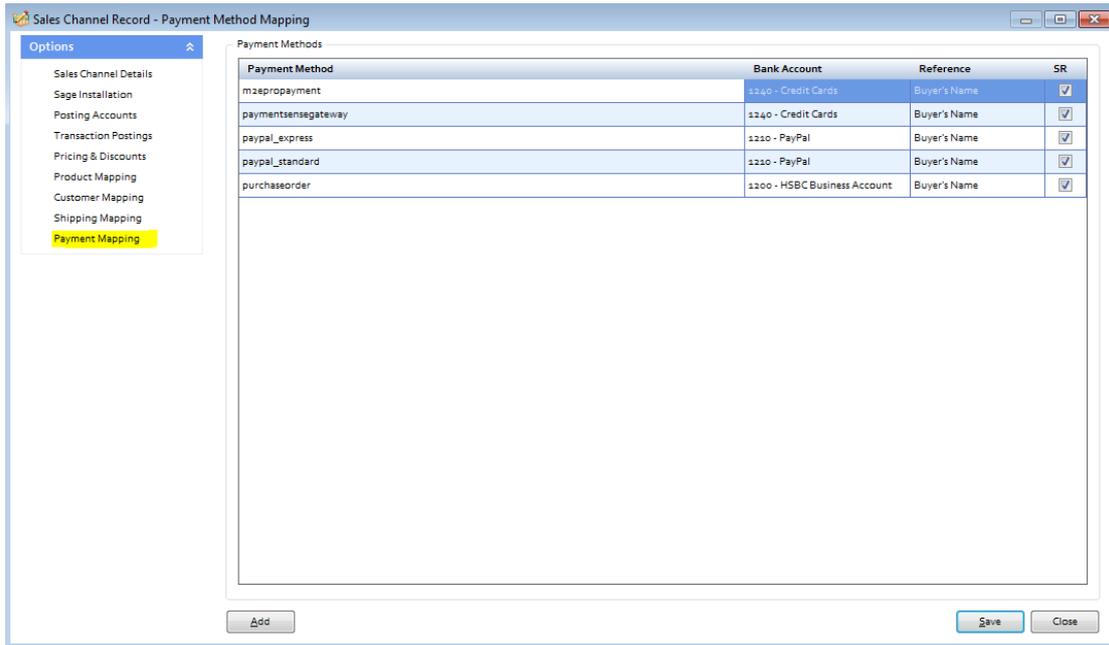

Alternatively, carriage can be displayed as a product line on an invoice. To do this a default carriage product needs to be selected from the drop down menu under the Carriage/Shipping section of the **Product Mapping screen**. Once done, the shipping method will appear as Stock Codes at the top of the Shipping Mapping screen. Each shipping method can then be allocated against an established carriage stock code in Sage.

Add shipping line even if value is zero allows the shipping method to still be included on the body of the invoice even if it is a free item.

Payment Mapping

The Payment Mapping allows the user to determine:

- Which payment methods are mapped to which Sage banks
- If the Sales Receipt (SR) should be paid into the Sage bank upon posting the invoice
- Which reference to use against the Sales Receipt (SR)

Optimising Tradebox and Sage Accounts for reporting

Before downloading sales from Magento there are a couple of final tweaks that will be greatly beneficial for reporting purposes.

Tradebox Settings

In Tradebox select the **Settings** option from the **Configuration** menu which will generate the Settings Screen. This is split into multiple tabs.

Downloads Tab

If you wish to download sales manually (i.e. on demand), tick the '**Always prompt for days/date to download from**' tick box. Every time a download is ran, Tradebox will always prompt the user to provide the number of days to go back.

If you wish to download automatically, choose the **Interval** option and from the dropdown list choose the download interval; every 30 minutes, 1 hour, 2 hours, 4 hours, 8 hours or 12 hours.

Dashboard Tab

Configure the settings to display the data as you wish to see it on the Tradebox Dashboard. The Group by Sage Code tick box groups products sold by the Sage Product Code, rather than the online SKU. This provides a more accurate overview of products sold where the same product has multiple online SKU's.

Sage Field Mapping Tab

This section shows which data is reported onto the Sage customer account record and the Sage invoice/order. For the invoice/order settings the following mappings are recommended:

- Order ID = Cust_Order_Number
- Order Taken By = Sales Channel Name
- Payment Method = Notes 1
- Shipping Method = Notes 2

Sage Invoice/Order List

The invoice/sales order list in Sage can be configured to provide useful 'at a glance' data by including certain columns. Right click on the column headers to reveal all of the available columns. Tradebox recommend including the following additional columns:

- A/C
- Customer Order No
- Order Taken By

Based upon the changes suggested in the Tradebox settings, the invoice list could look as follows:

No.	Type	Date	Name	Amount £	Printed	Posted	A/C	Customer Order No	Order Taken By
5346	Inv	27/07/2012	J N Brown	31.74			1487	100003476	Main Website
5347	Inv	27/07/2012	Vincenzo Zaccarini	94.74			1488	100003477	Main Website
5348	Inv	27/07/2012	B Conway	148.68			1489	100003478	Main Website
5349	Inv	27/07/2012	Hugo Gordon	73.44			GORD0001	100003479	Main Website
5350	Inv	27/07/2012	T Green	15.19			1490	100003480	Main Website
5351	Inv	27/07/2012	Gay Phillips	50.33			1475	100003481	Main Website
5352	Inv	27/07/2012	B Evans	25.62			1491	100003482	Main Website
5353	Inv	27/07/2012	James Murray	42.52			1492	100003483	Main Website
5354	Inv	28/07/2012	Mike Ridley	11.66			1493	100003484	Main Website
5355	Inv	29/07/2012	David Bajic	274.70			BAJIC001	100003486	Main Website
5356	Inv	30/07/2012	Keith Cole	56.07			COLE002	100003487	Main Website
5357	Inv	30/07/2012	Lee Bishop	62.94			BISH0002	100003488	Main Website
5358	Inv	30/07/2012	Keith Phillips	141.64			1112	100003489	Main Website

Where Tradebox has created the invoice/order, the user will be able to quickly ascertain:

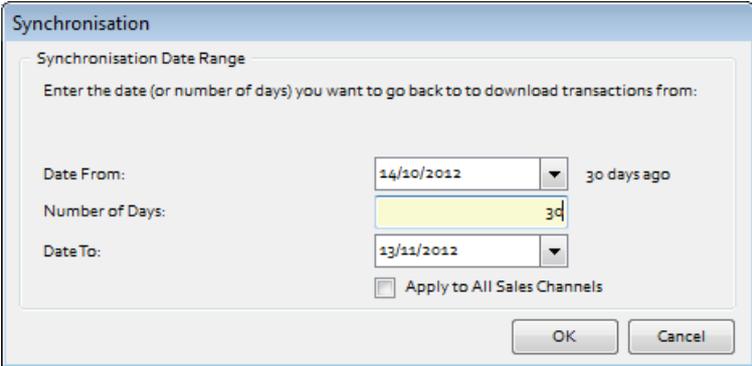

- The marketplace each invoice originated on
- The Magento order number
- Which Sage Customer Account the invoice relates to
- Who the invoice is for
- The date of the order
- Whether it has been printed and/or updated

Downloading Orders from Magento

Once the setup is complete, orders from Magento can be imported. To prevent common errors, ensure that:

- The Regional and Keyboard settings on the PC are configured for the UK.
- The time/date on the PC is configured for the UK

To download sales from Magento select the **Download** option from the **Operations** menu. The first time a Magento synchronisation is ran the following dialog box will appear:

Either enter the number of day's worth of sales in the 2nd box or enter a Date From and a Date To. Then select OK. Tradebox will only download sales that have NOT been previously downloaded. This ensures that duplication will not occur in Sage.

Running a download takes place in the **Operations Log** which will show a script of the download procedure, detailing how many transactions have been downloaded and how many invoices/orders have been created in Sage. If Tradebox encounters any issues during the download or posting to Sage. It will generate the following message:

**There may have been errors during the synchronisation for Sales Channel: XXXXXX
Check the Error Log for details**

Alongside the Operations Log are the **Process Log** and the **Error Log**. Click onto the Error Log to see details of each issue Tradebox has encountered. Generally errors are generated because of mapping issues. The most common of these are Product Mapping errors where Tradebox cannot match the SKU in the downloaded order to an existing Product Code in Sage. Select the **Error Corrections** button to generate a grid where the mappings can be done manually. To see an explanation of the common errors, select the **Common Errors** button.

Orders

To view a list of orders imported into Tradebox click on the **Orders** option under the **Information** menu. This will generate the 'Imported Orders Criteria' dialog box, with options to choose:

- Orders from all connections, or, orders from a specified connection
- The type of order you wish to see; Posted to Sage, Unposted or Pending.

The screenshot displays the 'Pending Orders' window in Tradebox Finance Manager 2013. The window features a left-hand navigation menu with categories like Business, Operations, Information, Configuration, Analysis, and Maintenance. The main area contains a data grid with the following columns: Select, Sales Channel ID, Billing Name, Sale Date, Order Status, Payment Method, Transaction Status, Qty, Stock Code, and Title. The grid lists 26 items, each with a checkbox, a sales channel ID (e.g., www.tradebox.uk.com), a billing name (e.g., Kinril Kondraashin), a sale date (e.g., 18/10/2012), an order status (e.g., Processing), a payment method (e.g., PayPal Express Checkout), a transaction status (e.g., SUCCESS), a quantity (e.g., 1), a stock code (e.g., B0081-0021-0007), and a title (e.g., iPhone 5 skin - Rossi wh). At the bottom of the grid, there are buttons for 'Change Status...', 'Select All', 'Swap', 'Clear', and 'Refresh Order Statuses...'. A status bar at the bottom indicates '19/10/2012' and an 'Important Message' about Tradebox Finance Manager V5.3.

The imported orders chosen in the dialog box are presented in a configurable grid. Columns can be added, removed and sorted into the order required by the user. To move the columns, simply click on the column headers and drag the column into the required position. To add or remove columns, right click on the column headers and from the drop down menu choose the **Select Columns** option. Data in the grids can be sorted in ascending or descending order by clicking on the column headers. Hovering the mouse above the columns will reveal a filter control . Clicking on the control allows the user to filter the grid by data in the column, for example showing all sales between 2 dates.

Customers

Regardless of whether you choose to create individual customer accounts in Sage or simply use a single generic Sage customer account, Tradebox will always hold comprehensive details of every individual customer that is processed through the software. To access the customer list simply click on the **Customers** option in the **Information** menu.

This will provide a configurable grid of customers that can sorted into the order required by the user. Data in the grids can be sorted in ascending or descending order by clicking on the column headers. Hovering the mouse above the columns will reveal a filter control . Clicking on the control allows the user to filter the grid by data in the column.

Double clicking into a customer will generate a customer details screen containing more in-depth information on the customer, as well as a history of purchases.

All customer details held in Tradebox can be exported into Excel by selecting the **Export** button.

Uploading Sage Stock Quantities back to Magento

Tradebox enables users to upload Stock Quantities back to Magento.

To do this, select the **Upload** option from the **Operations** menu. This will generate the following screen:

- Choose Upload Quantities to Magento
- Choose the relevant Magento Sales Channel and select OK.

A progress screen will show the upload and confirm when complete.

Quantities are taken directly from the free Sage Stock positions **only** for those Magento products mapped in the Product Mapping table.

Menu Options

Business	
Support	Contains serial number, version number, licence type, expiry date, Tradebox contact details, installation path, data path, logs path, videos, guides, send/receive database function, remote support link and repair & compact utility.
Dashboard	Link to dashboard overview of sales processed by Tradebox
News	Indicates new Tradebox news when emboldened . Clicks through to news page on Tradebox website
Messages	Indicates new message from Tradebox when emboldened and red. Clicks through to message page on Tradebox website
Operations	
Download	Runs the download function to connect to online sales platform and import new sales before automatically posting to Sage Accounts. Sales Channel must be turned on (status of YES) in the Sales Channel List for download to occur.
Error Corrections	Loads Error Corrections grid, where sales that cannot be automatically posted to Sage (usually because of mapping issues) can be manually corrected and then posted to Sage.
Post to Sage	Runs the function to send any unposted sales in the Tradebox database to Sage without connecting to the online sales platform first. If there are any errors at the end of the Post to Sage routine, an alert will be displayed in the Operations Log. Full details of each issue encountered during the Post to Sage will be displayed in the Error Log.
Upload	Runs the Upload function to pass Sage 'free' stock quantities back to the

	inventory on the selected sales platform.
Picking List	Generates a Picking List of products and quantities for the criteria provided in the dialog box.
Packing List	Generates a Packing List for each individual order containing SKU's, quantities, delivery information etc.
Labels	Generates Avery Standard label sheets (either 3 x 7 or 2 x 7) of delivery addresses
Amazon Shipping	Generates the Amazon Shipping confirmation grid from where Amazon orders can be marked as despatched and this information passed back to the Amazon marketplace.
Manual Order Entry	Opens the Manual Order Entry form, if a manual entry sales channel has been established in the Sales Channel List.
Information	
Sales Channels	Opens the Sales Channel List which contains an overview of each sales channel established in the software. Double clicking on a sales channel opens the configuration settings for that sales channel and allows the configuration to be amended as required.
Orders	Opens a list of orders downloaded or imported into the Tradebox database. Users can choose to see all orders or orders from a specified sales channel.
Customers	Opens a list of customers.
Fees	Accesses the list of fees imported from specific marketplaces, such as eBay and Amazon.

Logs	Opens the Process and error logs for each day
Search	Generates a search utility.
Last Download	Opens the Operations log for the last download. From here the user can also access the Process and error log for the last download.
Configuration	
New Sales Channel	Click on New Sales Channel to generate the Sales Channel Setup Wizard to create a new sales channel in Tradebox
Sales Channel Record	Opens the configuration settings for the Sales Channel selected in the Sales Channel List.
Settings	Opens the generic settings for the application which include download options, dashboard options, exchange rates, address/labels, countries table, Sage field mapping and the feedback screen.
Licence	Accesses the Programme Activation screen to enter serial numbers and activation keys to activate, renew or upgrade the software licence.
Analysis	
Reports	Access the reports section
Sales Channels	Provides analysis graph comparing sales channels in Tradebox by turnover or units sold in the last 12 months. By default all products sold are included but graph can be refined to compare specific products by sales channels.
Units	Provides a Calendar 3 year graph overview of units sold across all sales channels. Can be refined to drill down to units from a specified sales channel.

Turnover	Provides a Calendar 3 year graph overview of turnover across all sales channels. Can be refined to drill down to turnover from a specified sales channel.
Products	Provides a Calendar 12 month graph illustrating the performance of a specified product. Performance can be changed between units, turnover and average selling price.
Products (All)	Provides a Calendar 12 month grid of all units sold. The grid can include all sales channels or a single specified sales channel. Product performance can be presented as units or turnover.
Countries	Provides an 'all time' graph of countries sold to. Graph can display all countries or be grouped into UK, EU and rest of World Sales. By default sales from all sales channels are included, albeit this can be refined to present country sales from a specific sales channel.
Sales v Fees	Presents a line graph illustrating a Calendar year of sales against fees. Only applicable for Amazon and eBay where fees are downloaded.
Fees	Presents a graph of fees, broken down into specific types. Only applicable for Amazon and eBay where fees are downloaded.
Time of Day	Provides and 'all time' graph of the time of day sales are made from eBay only.
Day of Week	Provides and 'all time' graph of the day of the week sales are made from all sales channels. This graph can be configured for time frames, sales channels and swapped between units and turnover.
Day of Month	Provides and 'all time' graph of the day of the month sales are made from all sales channels. This graph can be configured for time frames, sales channels and swapped between units and turnover.

Amazon Margins	Exports Amazon sales and fees data into an Excel spread sheet, comparing income against fees for each products sold
eBay Margins	Exports eBay sales and fees data into an Excel spread sheet, comparing income against fees for each products sold
Maintenance	
Backup	Enables the Tradebox data to be backed up. Includes options to automate the back up on closing the programme.
Export Data	Where an Export File Format has been created (see below) this function exports the data from a given date range into the existing template which can then be saved.
Relocate Database	Allows the user to export the Tradebox database off the client PC to a shared network drive. Also enables users to point additional installations of Tradebox at the existing database on a shared network drive.
Rebuild Data	Allows users to rebuild data in the Tradebox database. This can be for all channels or for specified channels. Data that can be rebuilt (deleted) includes sales information as well as mappings.
Rebuild Sales Figures	All the data in the Tradebox database to be rebuilt and all analysis and reporting to be recreated.
Archive Order History	Allows Tradebox data, older than 30 days, to be archived to improve performance.
Export File Formats	Allows users to create an export template of specified fields in a given order into a csv or excel spread sheet. Once the template is created and saved, the chosen data is exported using the Export Data option (see above).

Clear Order History	Deletes data from the Tradebox database prior to a given date.
Reset Sage Postings	Allows invoices to be recreated in Sage a second time by resetting the internal sage invoice number in Tradebox prior to a given date or invoice number. Once rebuilt, Tradebox can repost the invoices into Sage.
Restore	Restores previous backups.
Security	Allows a password to be added to the program or an existing password to be deleted or changed.
